Stemroom

Musicians keep their songs and projects in one place.
Admins approve songs before they go public.

Review 1, online music collaboration platform (problem statement 22)

Team ByteForce
Om Singh, team lead
Aryan Sharma
Aditya Maurya

What it does

Musicians

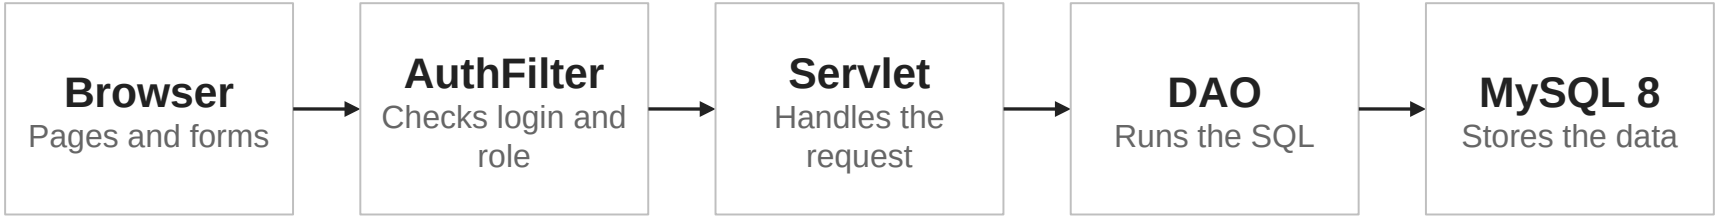

- Keep a portfolio of songs
- Start projects and add people by email
- Track each project status and deadline
- Upload songs, which wait for admin approval

Admins

- Manage accounts and roles
- Approve or reject songs
- Turn sign-ups on or off
- Set how many projects each musician can own

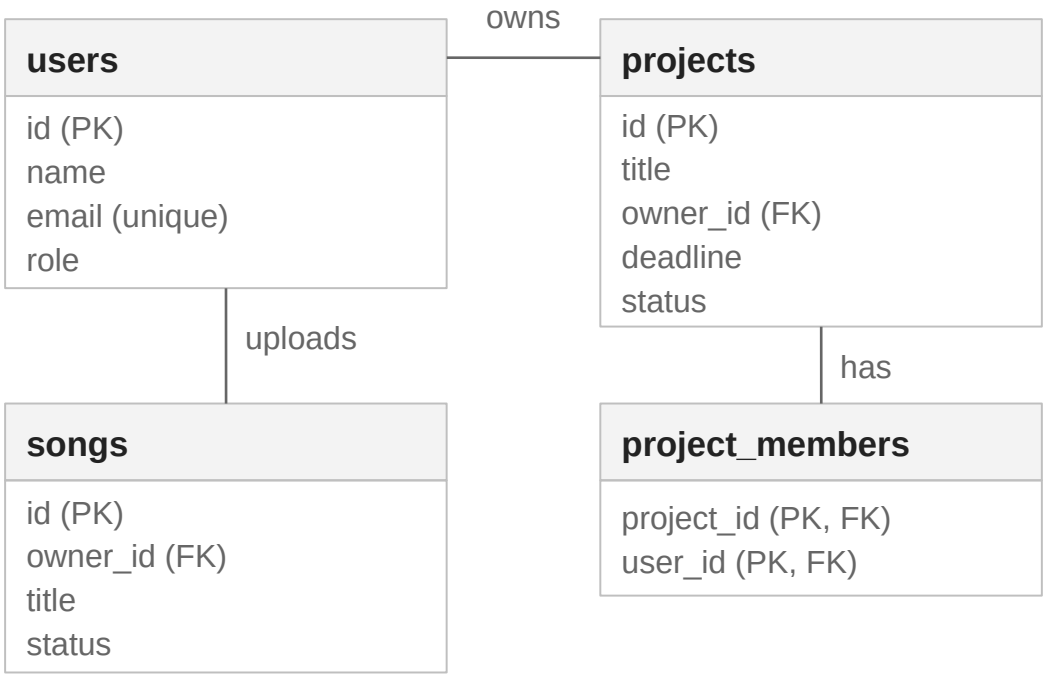

Left for Review 2: editing and playing songs, sharing songs in a project, comments, notifications and the activity monitor.

Architecture

A filter checks the login first. A servlet handles the request, a DAO runs the SQL, and a JSP page prints the result.

Database

Every new song starts as pending.

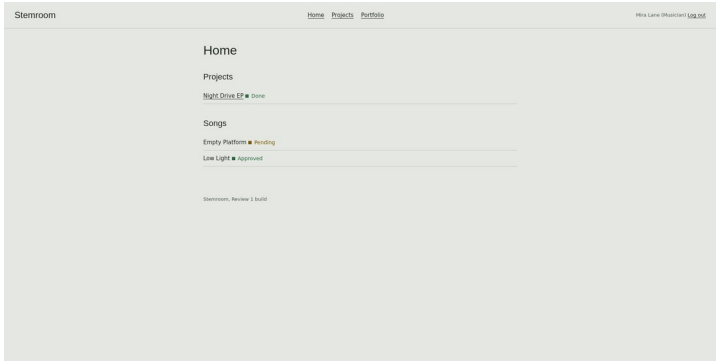

Deleting an account deletes what it owns.

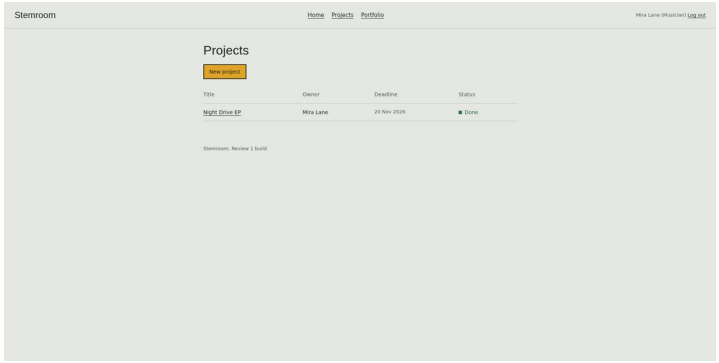

Code

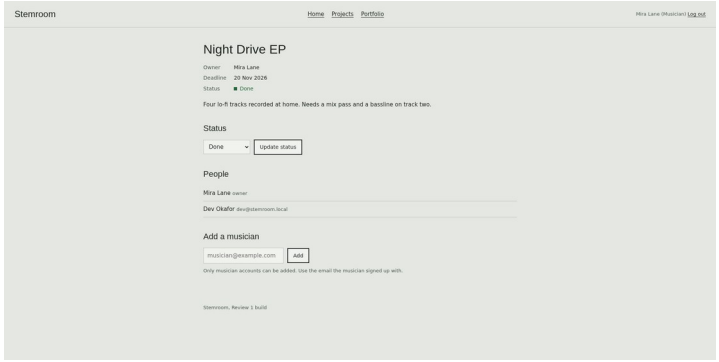

```
public List<Project> findVisibleTo(int userId) {
    return Db.query(SELECT
        + " WHERE p.owner_id = ? OR p.id IN"
        + " (SELECT project_id FROM project_members"
        + "  WHERE user_id = ?)"
        + " ORDER BY p.id DESC",
        ProjectDao::mapRow, userId, userId);
}
try (Connection c = connect();
     PreparedStatement ps = c.prepareStatement(sql)) {
    bind(ps, params);   // fills the ? marks
    try (ResultSet rs = ps.executeQuery()) {
        while (rs.next()) rows.add(mapper.map(rs));
    }
}
```

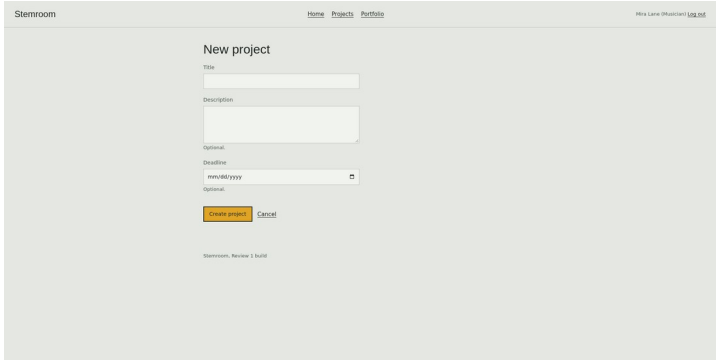

Values go in as parameters, so user input never becomes part of the SQL.
